

Rationale for This Series of White Papers

by

William A. Tiller

For the past forty years this author has been writing scientific papers, articles and books in the Psychoenergetic Science area, in parallel with his orthodox science work carried out as a materials science professor at Stanford University with his Ph.D. students during this same time period. The main purpose of this work was to awaken the consciousness of humanity, the lay public as well as the scientific community, to the importance of human consciousness and its focused development upon both (1) the progressive evolution of our latent human capabilities and spiritual perspectives and (2) the actual expansion of our orthodox science to perceive and beneficially utilize consciousness as a significant experimental variable in the study of nature's manifold expressions and opportunities.

Some significant progress has been made in the last four decades of our work towards creating a consciousness-inclusive science for humankind's future. However, today's orthodox physics paradigm and establishment has absolutely no capability of achieving such a goal. This is because they are not working within a reference frame large enough to even allow such a possibility. Today's quantum mechanics, quantum electrodynamics and relativity theory are stuck in spacetime and thus can only handle thermodynamic potential functions that are spatially (and temporally)-dependent. Whereas, experimentally, nothing about human consciousness or human intention appears to be spatially dependent!

Truth is always in the carefully gathered experimental data via use of the appropriate measurement instruments. Today's measurement instruments are primarily electromagnetic (EM) and thus are limited by signal velocities at the velocity of light ($v \leq c$). However, the greater limitation is the entrapment of the orthodox physics community by (1) their great expertise in specific areas of orthodox specialization, (2) their great hubris in thinking that they have all the relevant answers and (3) their great fear for their hard-won reputations if they are seen by their scientific peers to give serious credence to "outside-the-box" experimental data or theoretical thinking. It was the same in Galileo's day when the priests of that day would not seriously look at the experimental data!

In any event, sad as it is, how might one change that deficiency of our present world. What we have decided to do on this website is to write a series of "White Papers", both theoretical and experimental, that point to important, well-founded data or new concepts that should be seriously considered by thoughtful humans of both the lay public and orthodox science persuasion.
